Subject: USEPA East & West contaminant sites

With funding from US Fish and Wildlife Services the City of Troy has been considering a project to remove the low head dam on the Great Miami River near the east Troy site. We have been working with Scott Niekamp of Arcadis to update our wellfield model and determine what effect this project could have on the water supply to the water treatment plant.

We would like to set up a conference call with you and your staff next week to discuss our findings since the dam removal project has the potential to alter the direction and extents of the plumes in both the east and west troy contaminant sites. Please let me know your availability early next to discuss this.

Christy Butera

City of Troy
Assistant City Engineer
